

Butterfly Species Prediction

Hook Document for Case Study

May 2, 2023

Scenario

Butterflies and moths have distinct features and people have been trying to categorize them based on those features for a long time. In the era of data science, recognizing them by a computer visualization program has become possible. In this project, you will try to develop a machine learning model where the user can simply take a picture of the butterfly or the moth they come across outside and know what species that is. To accomplish this, you will use a visualization machine learning model and make predictions based on pictures of butterflies and moths.

Deliverables

- Select a proper model for this project and the reasoning for your selection.
- A simple explanation of how the model works.
- The testing predictions you made while making the model.
- The validating predictions you made for presentation purposes.
- The accurate measure of the model.
- Things that you can improve if you had more time working on this project.
- Questions you had while working on this project.
- Further steps.
